Penyelesaian Word Search Puzzle dengan Menggunakan Algoritma Brute Force

Laporan Tugas Kecil 1 IF2211 Strategi Algoritma Semester II Tahun 2021/2022

Disusun oleh:

Grace Claudia 13520078

I. PENJELASAN ALGORITMA

A. Algoritma Brute Force

Brute Force merupakan salah satu pendekatan penyelesaian masalah yang memiliki ciri-ciri khusus yaitu penyelesaian yang bersifat *straightforward*. Penyelesaian ini dilakukan dengan **sangat sederhana** dengan mengorbankan jumlah langkah penyelesaian masalah. Dalam program, pengaruh penggunaan algoritma Brute Force adalah durasi pengeksekusian program. Dengan pertimbangan ini, brute force kerap kali kita temukan hanya pada *testcase* yang kecil. Program dengan metode Brute Force cenderung memakan waktu yang sangat lama untuk *testcase* yang besar.

B. Algoritma Program secara General

- 1. Pembacaan input teks yang puzzlenya akan diubah kedalam bentuk matrix NxN bernama **puzzle**, kata yang dicari dikumpulkan dalam sebuah vector bertipe string dengan nama vector **points**
- 2. Untuk pengubahan puzzle ke matrix, akan dilakukan **iterasi satu-satu terhadap line** yang ada pada file dan berakhir jika line dalam file tersebut **tidak memiliki elemen ("")** yang berarti akan dilanjutkan dengan proses pemasukan kata yang dicari ke vector
- 3. Untuk pemasukan kata ke vector, akan dipisahkan terlebih dahulu puzzle yang berada di atas text file dengan penggunaan loop while, lalu sampai end of file, kata-kata yang dicari akan di push ke vector.
- 2. Mengiterate kata-kata yang terdapat dalam vector dan satu-satu dicari sesuai urutan kemunculan dalam file dengan algoritma brute force lalu mengembalikan vector berisi struct point yang berisi koordinat letak x dan y huruf pada kata yang ditemukan
- 3. Mendisplay character yang ditunjuk pada vector berisi point, selain itu diisi "-"

C. Penjelasan langkah-langkah algoritma brute force pada program

Pengunaan algoritma Brute Force terdapat pada fungsi **findKata()** yang menerima parameter berupa matrix dari puzzle dan sebuah string dari vector kata yang akan dicari. Fungsi ini mengembalikan **vector point yang berisi koordinat letak ditemukannya huruf dari kata** yang dicari yang nantinya digunakan untuk mendisplay. Langkah-langkah algoritma brute force adalah sebagai berikut:

1. Mengassign:

- lenkata dengan panjang dari kata yang dicari
- idxMin untuk pencarian koordinat x dan y yaitu 0
- idxJMax yaitu untuk pencarian maksimal koordinat y batasnya sesuai banyaknya kolom pada matrix puzzle
- idxIMax yaitu untuk pencarian maksimal koordinat x batasnya sesuai banyaknya baris pada matrix puzzle

- Counter untuk menghitung banyaknya perbandingan yang telah dilakukan untuk mencari kata tersebut
- 2. Menggunakan ukuran baris dan kolom dari puzzle untuk looping pengecekan kata yang dicari
- 3. Mengiterasi satu per satu character dalam puzzle dengan mengecek tempat dimana **letak huruf pertama** dari kata yang dicari
- 4. Jika ditemukan tempat dari huruf pertama tersebut akan dilakukan **pengecekan apakah panjang dari kata pada titik tersebut memenuhi** untuk dicari ukurannya dalam matrix agar tidak terjadi index out of bounds. Pengecekan ini membutuhkan value idxMin, idxJMax, dan idxImax.
- 5. Selanjutnya apabila panjang kata memenuhi ukuran matrix maka akan dilakukan **pengecekan dari huruf kedua sampai terakhir** dengan urutan atas, bawah, kiri, kanan, diagonal ke atas kiri, diagonal ke atas kanan, diagonal ke bawah kiri, diagonal ke bawah kanan (tentunya pengecekan dilakukan hanya jika memenuhi syarat batas ukuran matrix, jika tidak maka akan skip pengecekan).
- 6. Prosedur pengecekan:
 - 1. Jika sudah memenuhi kriteria maka akan dilanjutkan dengan membuat vector points yang kosong
 - 2. Vector points ini berguna jika index ke-x dari sebuah string sama dengan elemen matrix[i][j] yang diiterate, maka koordinat i j akan **di push ke vector points**
 - 3. Apabila banyak elemen dari vector points sama dengan panjang kata, maka dipastikan koordinat-koordinat tersebut adalah jawabannya, jika tidak maka akan dilanjutkan pengecekan ke arah selanjutnya.
- 7. Jika pengecekan tersebut benar dan ditemukan koordinat masing-masing huruf yang sesuai maka akan **di store ke suatu struct point.**
- 8. Jika tidak ditemukan, akan mengeluarkan output "Word doesn't exist"

II. SOURCE PROGRAM

Struct Point, Function newMatrix dan newWord

```
int x, y;
   vector< vector<char> > newMatrix(const char* filename) {
        // fungsi ini digunakan untuk membuat matrix sesuai input file user
        vector< vector<char> > mat;
        string line;
        ifstream file;
        file.open(filename);
        if (file.is_open()) {
           getline(file, line);
           while(line != "") {
    vector<char> temp;
                for (int i = 0; i < line.length(); i+=2) {</pre>
                    temp.push_back(line[i]);
                mat.push_back(temp);
                getline(file,line);
            cout << "failed to open the file" << endl;</pre>
35 vector<string> newWord(const char* filename) {
        vector<string> words;
        string line;
        ifstream file;
        file.open(filename);
        if (file.is_open()) {
           vector<char> temp;
           getline(file, line);
                getline(file,line);
            while(getline(file,line)) {
                words.push_back(line);
            file.close();
            cout << "failed to open the file" << endl;</pre>
        return words;
```

Procedure displayMatrix dan displayAnsMatrix

Function FindKata

```
vector<Point> findKata(vector< vector<char> > m,string kata, int* totalComp){
        int lenKata = kata.length();
        int idxMin = 0;
        int idxJMax = m[0].size();
int idxIMax = m.size();
        int counter = 0;
        for (int i=0; i<m.size(); i++){</pre>
             for (int j=0; j<m[0].size();j++){
                counter++;
                 if (m[i][j] == kata[0]){
                     // mengecek lurus ke atas
if (i-(lenKata-1)>=idxMin){
                         vector<Point> Points;
                          for(int x = 0; x<lenKata; x++) {</pre>
                             if (m[i-x][j] != kata[x]) {
                                 Point P;
                                  P.y = j;
                                  Points.push_back(P);
                          if (Points.size() == lenKata) {
                              *totalComp += counter;
                     if (i+(lenKata-1)<=idxIMax){</pre>
                         vector<Point> Points;
